

## **Elysian Systems releases multi-asset Electronic Trading System**

Liquid version 4 launched in North America by Tullett Prebon

London, September 16, 2008: Elysian Systems, an independent provider of exchange and electronic trading technology, has released a new version of Liquid, its electronic trading platform.

Targeted at exchanges and brokers, Liquid version 4 adds functionality enabling online trading in energy, commodity, fixed income and financial instruments. Market operators deploying Liquid can offer side by side trading of listed and OTC contracts for either anonymously cleared or bilaterally settled markets.

Liquid 4 offers a new, highly configurable and intuitive user interface allowing traders to configure the application to manage their orders more efficiently and trade more rapidly.

Functional and performance enhancements were made to the Liquid API – application programming interface - allowing brokers to offer algorithmic trading solutions to their markets.

Liquid 4 was successfully launched on September 2<sup>nd</sup> by one of the worlds largest interdealer brokers Tullett Prebon (LSE:TLPR) in North American electricity and gas markets.

“This latest version of the Liquid Trading Platform not only provides our clients with the capability to offer electronic trading across a diverse range of asset classes, but also incorporates the flexibility to tailor the system to support the functionality demanded by certain markets. Liquid 4 has been extremely well received by both traders and brokers and we look forward to adding to our impressive list of clients in the near future.” said Julian Anstes CEO at Elysian Systems.

### **About Elysian Systems**

Elysian Systems produces real-time electronic trading and market data software for the financial services industry. Its flagship product, Liquid, is a highly advanced trading platform that enables users to host global electronic market places across a wide range of asset classes.
